Customer Journey Map

Date: 2 July 2026	Team ID: —
Project Name: Caption AI : AI Powered Social Media Caption Generator	

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1: Discovery & Initialization	Stage 2: Setup & Local Deployment	Stage 3: Global Generation & Output
Actions What does the customer do?	Navigates to the local browser panel workspace to launch the content assistant dashboard interface.	Enters specific social visual descriptions, selects desired tone profiles, and triggers generation checks.	Copies the platform-optimized output string and pastes it directly to live brand feeds.
Touchpoint What part of the service do they interact with?	HTML5 DOM frontend workspace dashboard interface panel viewport.	Python Flask micro-server application routing script configuration layers.	Secure remote external gateway point-to-point network tunnel proxy domain.

Phase of Journey	Stage 1: Discovery & Initialization	Stage 2: Setup & Local Deployment	Stage 3: Global Generation & Output
Customer Thought What is the customer thinking?	"I hope this runtime environment initializes seamlessly without any path resolution validation locks."	"Will this setup process my visual parameters quickly without breaking under private API credential blocks?"	"These captions fit character constraints perfectly. This cuts out hours of manual work!"
Customer Feeling What is the customer feeling?	Optimistic but slightly cautious regarding initial system routing errors or scripting bottlenecks.	Focused on ensuring robust parameter execution and secure inline token authentication flow.	Relieved, productive, and highly confident in sustained automated scheduling.
Process Ownership Who is in the lead on this?	Anushka Saini (Project Manager / Technical Lead)	Anushka Saini (Project Manager / Technical Lead)	Anushka Saini (Project Manager / Technical Lead)
Opportunities How can we improve this stage?	Integrate dynamic frontend pre-validation alerts to check micro-server status before text entries are initialized.	Build secure environment variable validation monitors to verify remote tokens before handling execution loads.	Develop multi-threaded concurrent generation pipelines to enable batch caption creation.
